EUROPEAN COMMISSION  
DIRECTORATE-GENERAL FOR ECONOMIC AND FINANCIAL AFFAIRS

*In this number :  
Capacity utilization  
in industry*

## Supplement B

Business and Consumer  
Survey Results

No 8/9 – August/September 1995

### THE MAIN POINTS IN BRIEF

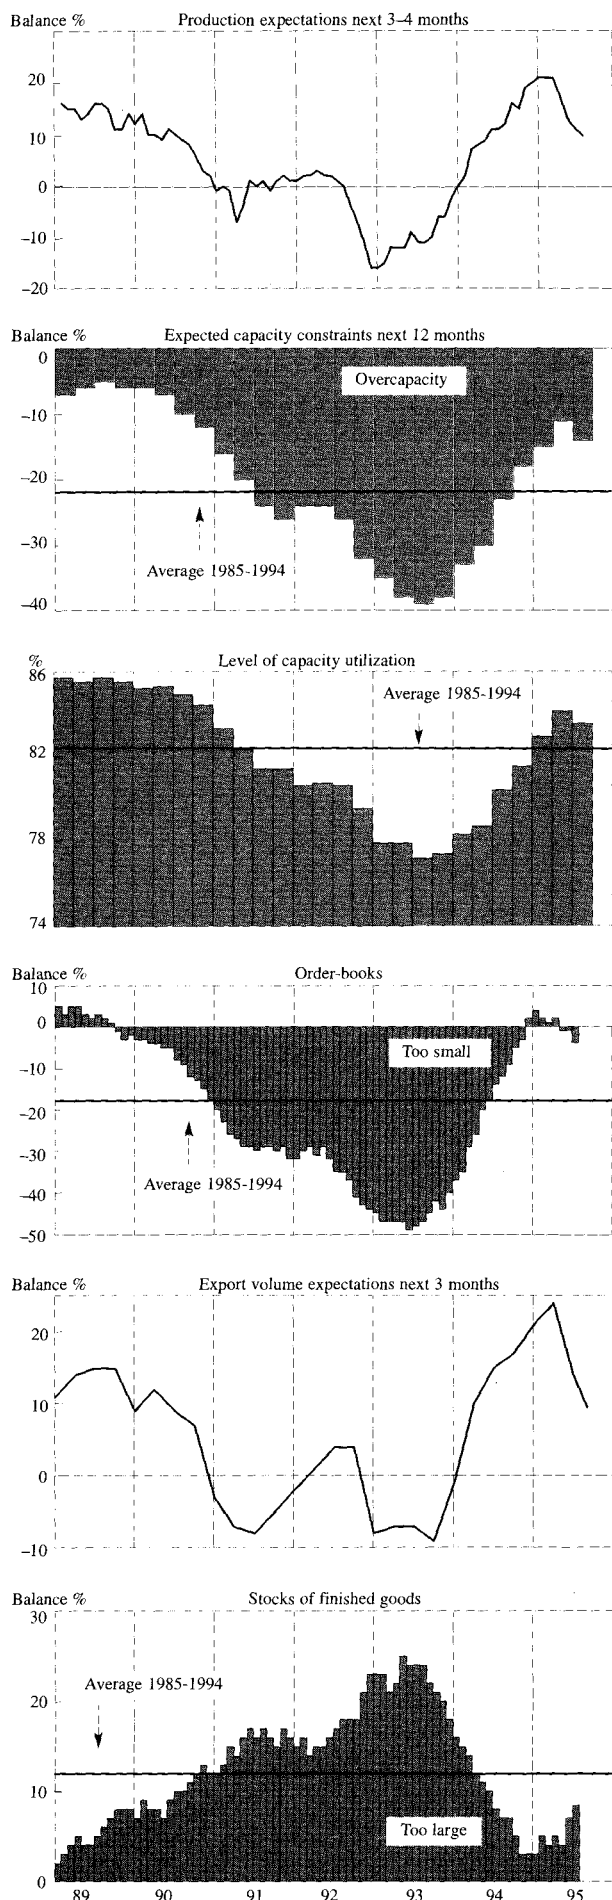

- For the first time in two years, the *capacity utilization rate* in manufacturing industry faltered. After reaching a peak for the current upswing of 84.1% in April, it fell back to 83.4% in July.
- The *EU's leading indicator of economic sentiment* showed only a slight change in all countries, confirming that the current upswing has stalled.
- As in the previous months, the *consumer confidence indicator* remained static in August, unchanged from its long-term average.
- However, the recent deterioration of the climate in *retailing* did not continue; retailers were more confident again and expected a more favourable trend of business activity.

GRAPH 1 : Indicators of economic sentiment —  
European Community (s.a.)

<sup>(1)</sup> See notes to Table 7.

GRAPH 2 : Indicators of output and demand in industry — European Community (s.a.)

The economic climate in the European Union was still gloomy in July and August. The most recent results of the business surveys, which also contain some values for August, reveal a further slowdown in growth both in *industry* and, above all, in *construction*, where order-book assessments are once again significantly more pessimistic than in the previous month. In industry, the order backlog continued to be viewed by managers – despite the increase in pessimism compared with the previous month – as more than adequate for the planned level of output. The same applies to export order levels. Admittedly, the survey results indicate substantially weaker new orders in industry, although this is probably due in part to the increasing uncertainty on foreign-exchange markets and to a weak dollar. Managers' assessments, which are generally characterized by diminishing optimism, suggest that growth prospects will be fairly subdued, even though expectations regarding the coming months continue on balance to be positive.

By contrast, the deteriorating climate in the *retail trade* has not become any worse recently; retailers were more confident and are expecting a more favourable trend of business activity. This is reflected in their declared intention to place more orders.

In August *consumer confidence* remained static, with the indicator unchanged – as in previous months – from its long-term average. The indicator's stability in August was influenced in particular by consumers taking a more favourable view of their own current and future financial situation. For consumers, it is, if anything, the general economic situation that prompts uncertainty, with such uncertainty being underscored by heightened fears of rising unemployment in the next twelve months.

**Capacity utilization in industry has declined.** The capacity utilization rate in manufacturing industry has fallen for the first time in two years. Having reached its peak for the current upswing of 84.1% in April (only 1.7 percentage points lower than the peak in the previous upswing), it fell back in July to 83.4%. Without the sharp decline in the United Kingdom, there would have been no change compared with the previous quarter. Despite the fall in the utilization rate, industrialists do not see any additional spare capacity coming on stream in the months ahead: on balance, a majority of industrial firms (albeit a smaller one than in the last quarter) regards productive capacity as more than sufficient to meet expected demand in the next twelve months. This suggests that industrialists do not expect the demand trend to fall sharply in the coming months. At the same time, they reckon that, in the immediate future, inflationary strains will tend to diminish and see little scope for charging higher prices. The uncertainty discernible in the surveys should probably be seen against the background of the persistent undervaluation of the dollar.

The chief cause of the decline in the rate of industrial capacity utilization in the European Union was the pronounced fall in the United Kingdom (by close on 3 percentage points). In five other Member States (Belgium, Denmark, Spain, France and Ireland), plant utilization was also reported as being down, by between 0.7% and 1.8%, on the previous quarter. In the other countries, however, capacity utilization continued to rise – in Germany by 0.5%, in Greece and Luxembourg by 0.4%, in Italy and the Netherlands by 0.3%, and in Portugal by 0.1%.

The EU's leading indicator declined again in July and, according to provisional calculations, in August as well. The EU's leading indicator of economic sentiment showed only a slight change in all countries, confirming that the current upswing has stalled. However, the fact that the indicator is still high means that the economy is continuing to grow. Although the climate in industry and construction had a negative effect, the indicator held steady on the back of consumer confidence and the trend of share prices. As regards the future trend, much will depend on what happens on the foreign-exchange markets.

2 October 1995

\* Used data-signs in the tables : (s.a.) = seasonally adjusted ; = not available.  
The figures for the Federal Republic of Germany refer to Western Germany, if not mentioned otherwise.  
Source, unless stated otherwise : European Community business surveys.

(a) The data are collected in January, April, July and October each year.

(b) The series for the United Kingdom are estimated using the national (Confederation of British Industry) data on the percentage of firms reporting below-capacity working.

(c) Answers to the questions whether, taking into account the level of order-books or production capacity is more than sufficient (+), sufficient (=) or less than sufficient (-).  
This, negative balances (capacity less than sufficient) indicate high levels of capacity utilization and positive balances (capacity more than sufficient) are associated with low levels of capacity utilization.

(a) The sum of the replies for each Member State are weighted in the Community total with the value of consumers' expenditure.

(b) The indicator represents the arithmetic average of results for five questions, namely the two on the financial situation of the household, the two on the general economic situation, and that concerning major purchases at present.

(c) If monthly data are not available, the EUR-averages incorporate the most recent available results.

\* DK Max. 88/91 and Min. 92/93 UK Max. 88/89 and Min. 90/93.
